‘How Fragile Is Her Future?’ Research
France

Prepared for the International Osteoporosis Foundation
and
Sponsored by an educational grant from Lilly
Research Methodology

- Computer-Aided-Telephone-Interviews conducted amongst GPs and postmenopausal women in each of the following countries:
  - U.K., France, Germany, Italy, Spain, Canada, Australia, Jordan, Mexico, Brazil, Lebanon
  - (Face to face interviews conducted in Middle East and Mexico)
- 100 interviews conducted amongst GPs and 50 amongst postmenopausal women
- GP sample purchased by pharmaceutical list leasing providers
- Consumer sample via random digit dialling and identified through screening questions
- In each country 5 pilot interviews conducted amongst GPs and necessary changes made to final questionnaire
- GPs paid an incentive of £15. No incentives offered to consumers
- Fieldwork dates for GPs: 3rd - 28th April 2000
- Fieldwork dates for consumers: 6th March - 4th April 2000
Main Findings
French Consumers
Q.2 Age of respondents

Mean: 63 years

Base: All female respondents aged 41+ and been through menopause (n=56)
Q.4 Whether suffering from osteoporosis

- Yes: 23%
- No: 63%
- DK: 14%

Base: All female respondents aged 41+ and been through menopause (n=56)
Q.5 Number times visited GP in last 12 months

Mean: 7 times

Base: All female respondents aged 41+ and been through menopause (n=56)
Q.6 Key health concerns (spont)

- Heart/cv disease: 45%
- Cancer (nsf): 21%
- Bone/osteoporosis: 16%
- Breast ca: 7%
- Arthritis: 4%
- Respiratory: 4%
- None/DK: 25%

Other health concerns mentioned on individual basis

Across all countries 27% of women stated osteoporosis

Base: All female respondents aged 41+ and been through menopause (n=56)
Q.7 Main health concern

- Heart/cv disease: 38%
- Cancer (nsf): 14%
- Bone/osteoporosis: 12%
- Breast ca: 7%
- Nothing/DK: 10%

Other health concerns mentioned on individual basis
Across all countries 21% of women stated osteoporosis

Base: All female respondents who currently have health concerns (n=42)
Q.8 Current activities to improve/maintain long-term health

- Eat healthily: 59%
- Drink water: 30%
- Exercise: 30%
- Vitamins: 25%
- Calc. supp: 14%
- Take med: 7%
- O/p med: 13%
- Nothing/DK: 13%

Other activities mentioned by individual respondents:
- In total 29% mentioned vitamins/supplements/med

Base: All female respondents aged 41+ and been through menopause (n=56)
Q.9 Diseases screened for over last 5 years

- Breast ca: 46%
- High Cholesterol: 32%
- Heart disease: 21%
- Cancer (nsf): 16%
- Osteoporosis: 9%
- Thyroid: 4%
- None/DK: 18%

Across all countries 20% had been screened for osteoporosis

Base: All female respondents aged 41+ and been through menopause (n=56)
Q.10 Whether been screened for osteoporosis

- Yes: 8%
- No: 86%
- DK: 6%

Base: Respondents who do not spontaneously mention they have been screened for osteoporosis (n=51)

Q.11 Reasons for being screened for osteoporosis

Base: 9

- At risk as post-men. 2
- Suffered vertebral fracture 2
- Asked Dr to be screened 1
- Suffered a hip fracture 1
- Suffered from fracture 1
- Family history of o/p 1
- Aching shoulder/stiff neck 1
- Don’t know 1
Q.12 Awareness of Osteoporosis Screening Programme

Base: Respondents who have not been screened for osteoporosis (n=47)
Q.13 Long-term health risks associated with osteoporosis (prompted)

Base: Postmenopausal women aged 41+

Increased risk of further fractures 91%
Loss of height 61%
Reduced quality of life 52%
Fear of next fracture/fall 52%
Long term pain 50%
Loss of self esteem 25%
Inability to live independent life 16%
None of the above 5%
Q.14 Proportion suspected osteoporosis prior to diagnosis

Across all countries 33% of respondents suspected they had the disease prior to diagnosis.

- Yes: 46%
- No: 38%
- DK/NA: 15%

Base: Osteoporosis Sufferers (n=13)
Q.15a Impact osteoporosis has had on quality of life

Base: Osteoporosis sufferers 13
Back pain 6
Live in fear of breaking bone 3
Had to reduce activities 3
Less able to get from place to place 3
Can’t go for long walks 2
I worry about the future 1
Cannot pick up grandchildren 1
I feel less attractive 1
Cannot lift heavy weights 1
Cannot participate in sports 1
Living independently without carers 1
Play more sport 1
None/DK 3
Q.15b Whether suffered from a fracture caused by osteoporosis

Base: Osteoporosis sufferers (n=13)

It took the respondent who suffered from a fracture 6 months to 1 year to recover.
Q.16 Whether aware at risk from osteoporosis prior to diagnosis

<table>
<thead>

Base: Osteoporosis sufferers (n=13)
Q.17a Precautions would have taken if knew were at risk

Base: Osteoporosis sufferers unaware at risk of osteoporosis (n=7)
Q.17b One thing sufferers would tell other women about osteoporosis

- DK/NA: 5
- Drink water: 1
- Get screened for o/p: 2
- Take Prev medicine: 2
- Calc supp: 3

Base: Osteoporosis sufferers (n=13)
Q.18 Likelihood of developing osteoporosis

- Very likely: 9%
- Fairly likely: 28%
- Not very likely: 33%
- Not at all likely: 2%
- Don't know: 28%

Mean: 2.6
- Very likely +4
- Not at all likely +1

Base: Non-osteoporosis sufferers (n=43)
Q.19 Degree of concern about long-term health risks of osteoporosis

**Very concerned:** 39%

**Fairly concerned:** 36%

**Not very concerned:** 16%

**Not at all concerned:** 4%

**Don't know:** 5%

**Mean: 3.2 vs. 2.5 across all countries**
Very concerned +4
Not at all concerned +1

Higher agreement from sufferers (3.8 vs. 3.0)

Base: All female respondents aged 41+ and been through menopause (n=56)
Q.20 Whether discussed osteoporosis with doctor

- Yes: 50%
- No: 50%

Q.21 Reasons for discussing osteoporosis with a doctor

Base: All female respondents aged 41+ who have been through the menopause (N=56)
Q.22 Whether discussed long-term health risks of osteoporosis with doctor

- Yes: 43%
- No: 53%
- DK: 4%

Q.23 Reasons for not discussing long-term health risks of osteoporosis with a doctor

- Doctor didn’t raise it: 8
- I am too scared to do so: 6
- Got too many other problems: 3
- Don’t want to think about risks: 2
- Don’t know: 1

Base: Respondents who have discussed osteoporosis with their doctor (n=28)
Q.24 Extent of agreement that osteoporosis can be prevented

- Strongly agree: 64%
- Tend to agree: 23%
- Tend to disagree: 4%
- Strongly disagree: 0%
- Don't know: 9%

Mean: 3.7
- Strongly agree +4
- Strongly disagree +1

No difference in agreement between sufferers vs. non

Base: All female respondents aged 41+ and been through menopause (n=56)
Q.25 Best ways of preventing osteoporosis

Base: Respondents who agree osteoporosis can be prevented 49%

- Calcium supplements 55%
- HRT 51%
- Healthy diet 49%
- Exercise 33%
- Using specific osteoporosis treatment 31%
- Vitamin D 24%
- Using SERMs 22%
- Use phytoestrogens 4%
- Use bisphosphonates 2%
- Vitamins 2%
- Don’t know 6%
Q.26 Therapy options doctor has discussed in relation to osteoporosis

Base: Respondents who have discussed osteoporosis with their doctor (n=28)
Q.27 Whether currently taking medication for osteoporosis/hormonal problems

3 osteoporosis sufferers were not on treatment: one didn’t want to take medication, one was afraid of side effects and the other 3 did not know

Base: All female respondents aged 41+ and been through menopause (n=56)
Attitude towards long-term preventative therapy for osteoporosis

Q.29 Whether consider taking long-term prevention therapy for osteoporosis on dr. recommendation

- Yes: 64%
- No: 21%
- DK: 15%

Q.30 Concerns that would stop women taking long-term prevention therapy

Base: Respondents not taking long-term prevention of osteoporosis (n=48)

- If they didn’t work: 40%
- Side effects: 31%
- Concerns over risk of cancer: 13%
- Inconvenient to take: 10%
- Concerns over breast ca: 8%
- Don’t want to take l/t med: 6%
- Concerns over risk breast ca with HRT: 2%
- Concerns over HRT: 2%
- Don’t know: 29%
Q.31 Products ever used for the prevention/treatment of osteoporosis

Don't know 11%
Calc/Mag 4%
Calc/Vit D 5%
HRT 7%
Climesse 7%
Premique 9%
None 75%

Individual mention of Fosamax, Livial and Estraderm

Base: All female respondents aged 41+ and been through menopause (n=50)
Q.32 Products currently using for the prevention/treatment of osteoporosis

- None/DK: 5
- Estraderm: 1
- Calc/Vit D: 2
- Calc/Mag: 2
- Climesse: 2
- Premique: 5

Base: Respondents who have ever taken therapy for osteoporosis (n=16)
Q.33 Agreement with statements

Base: Postmenopausal women aged 41+

- Osteoporosis should be viewed as a serious condition: 98%
- It is very important to effectively prevent osteoporosis: 90%
- It is very important to effectively prevent spinal fractures: 81%
- Getting fragile/brittle bones is part of the ageing process: 71%
- Drs generally have enough resources to effectively manage o/p: 68%
- Drs in this country do not seem to take o/p seriously: 65%
- If you can prevent/treat vertebral fractures you can prevent hip: 64%
- A medicine that can treat a disease is generally more effective than one that can just prevent it: 58%
- I would like to be/wish I had been screened for o/p: 57%
- Osteoporosis is not a life-threatening condition: 56%
- If I had a vertebral fracture I am sure I would know about it: 56%
- I wish I had taken medication earlier to prevent o/p: 46%
- I feel that I have enough information/knowledge on o/p: 50%
- I am concerned about l/t risk to health of taking HRT: 42%
Summary
The average age of the women taking part in the survey was 63, of whom 23% were suffering from osteoporosis.

On average the women had visited their GP 7 times in the last year.

The women’s health concerns were heart disease (>two-fifths), cancer (fifth) and osteoporosis <fifth (cf >quarter across all countries surveyed. A quarter of women claimed to have no health concerns.

The one main health concern that the women had was again heart disease (>third). Osteoporosis was mentioned by >tenth as their main health concern, compared with fifth across all countries.
Summary

- Two-thirds of women said that they ate healthily to improve or maintain long term health. One-third said they drink lots of water, with a similar number taking exercise.
- Quarter of women said they used vitamins/supplements/medication to improve or maintain long term health. Tenth of women did nothing to maintain long term health.
- Fifth of the women said they had been screened for osteoporosis - much lower than that reported across all countries (34%). None of the women reported that they were screened because their doctor recommended it.
- Half the women who had not been screened were aware that there was a screening programme.
The key things women associate with osteoporosis are increased risk of further fractures (91%), loss of height (two-thirds) reduced quality of life, long term pain, and fear of the next fracture/fall (all mentioned by half of women)

<half the women with osteoporosis suspected they had the disease prior to diagnosis

Three-quarters of the sufferers said that the disease had a major impact on their quality of life – with back pain being the problem which most women cited

<half the women with osteoporosis were aware that they were at risk prior to diagnosis
Summary

- 5 of the 7 women said they would have taken medication for prevention if they had known they were at risk of osteoporosis.
- 3 of the 13 women sufferers said they would suggest to other women that they should take calcium supplements and 2 of the 7 said they would recommend that they went on preventative medication and/or get screened for osteoporosis.
- >third of women said they felt they were likely to develop osteoporosis in the future and 75% were concerned about the long term health risks of the disease.
- Half the women had discussed osteoporosis with a doctor (cf average of 44% across all countries), mainly because the women had read/heard about the condition.
Summary

- Two-fifths of the women who had discussed the disease with a doctor went on to discuss the long term health risks.
- 87% of the women believed that osteoporosis can be prevented, with the best way of preventing being calcium supplements or HRT (>half). <half the women said the best way of prevention was via a healthy diet, a third exercise and <third through using specific osteoporosis medications
- 4 out of 10 women who had discussed osteoporosis had not discussed therapy options with a doctor. <half had discussed calcium supplements, >quarter were just recommended lifestyle measures and >tenth SERMs
- Half the women were currently taking medication for osteoporosis/hormonal problems, although <tenth were on treatment and >tenth on prevention
Summary

- Two-thirds of women would consider taking long term preventative therapy if recommended by their doctor, with lack of efficacy being the main concern that they would have (two-fifths)
- Almost all the women agreed that osteoporosis should be viewed as a serious condition
- 9 out of 10 women agreed that it was very important to effectively prevent osteoporosis
- 8 out of women agreed that it is very important to effectively prevent spinal fractures
- 7 out of 10 women believe that fragile bones is part of the ageing process
Summary

- 3 out of 10 women do not believe that doctors in France have enough resources to effectively manage the disease.
- 6 out of 10 women believe that doctors don’t take osteoporosis seriously in France.
- Two-thirds of women believe that if you can prevent vertebral fractures you can prevent secondary fractures.
- 6 out of 10 women wished they had been screened for osteoporosis.
- 4 out of 10 women believe osteoporosis to be a life-threatening condition.
- 5 of out 10 women believe that if they had a vertebral fracture they would know about it.
Summary

- 5 out of 10 women wished they had taken preventative medication
- 5 out of 10 women do not feel they have sufficient information on the disease
- 4 out of 10 women are concerned about the long term risks to their health of taking HRT
French GPs

It is often the case that o/p is not diagnosed until a woman presents with a fracture 16%
The screening programme for o/p is sufficiently funded 7%
Summary

- Only 6% of GPs held a menopause surgery in their practice and 4% an osteoporosis clinic.
- On average the GPs estimated they had 553 postmenopausal women in their practice.
- The one key health concern the doctors have for their postmenopausal women is osteoporosis (third), with the next most frequently mentioned main concern being hot flushes (15%).
- When looking at all health concerns for postmenopausal women, two-thirds stated osteoporosis, a quarter hot flushes and >fifth heart disease.
4 out 10 GPs said they occasionally conduct health risk assessments, a third routinely and <tenth proactively. >tenth said they never conduct health risk assessments.

Half the doctors didn’t feel that anything was limiting the level of overall health status reviews that they conduct (cf fifth of ‘all doctors’. >tenth of GPs did not see health status reviews as a priority, with a similar number saying the limiting factor was that women do not ask for them.

A third of GPs defined ‘treatment’ as rxing a specific product class. >quarter defined it as starting medication when a woman is at risk (vs. <half of ‘all doctors’).
Summary

- Four-fifths of GPs felt that the most negative effect of osteoporosis was fractures, followed by pain (40%) and curvature of the spine (20%)
- On average the GPs estimated that 40% of their postmenopausal women would be receiving medication for ‘treatment’ and 50% for ‘prevention’
- A quarter of GPs felt that there was nothing inhibiting them from rxing medication for the prevention of osteoporosis. A fifth felt the fact that women don’t comply with this type of medication was inhibiting them
- A fifth of GPs felt that the biggest challenge they face when treating preventatively after the menopause was compliance, with a similar number saying patients concern over side effects
Three-quarters of the GPs said that Rheumatologists would also be likely to rx for osteoporosis and >half gynaecologists looking across all countries, rheumatologists have a greater role to play in France (78% vs. 31% across all countries
Summary

- A quarter of GPs felt that a product which is well tolerated affected their decision as to which product to rx for long term medication. A fifth felt patient preference was a factor in their decision.
- Two-thirds of GPs felt that women did not consult them at an early enough stage.
- A third of GPs felt that the **most** important feature of an osteoporosis product was that it increases BMD. A fifth felt it was efficacy.
- When looking at all important features 4 out of 10 GPs felt tolerability and increase in BMD was important, followed by efficacy, convenient to take and stops fractures (<quarter) was important.
There was strong agreement (90%+) that ideal candidates for preventative medication would be women going through an early menopause and those with family history of osteoporosis. Only 4 out of 10 GPs felt that perimenopausal women were ideal candidates.

Almost all the GPs (96%) recommend to postmenopausal women that they increase their exercise, >half follow a correct diet and >third increase their calcium intake.

9 out of 10 GPs strongly agreed that “compliance is an important factor in a drug’s efficacy”.

<third of GPs felt that the reason for patient non-compliance was because it is long term treatment and/or women ignore the severity of the condition.
Summary

80% of GPs have had the situation where women have refused recommended osteoporosis treatment. Just under a third of these GPs felt this was because they dislike taking medication, with a quarter saying they don’t want to take long term medication.

Almost all the GPs (95%+) agreed that their goal should be to prevent women suffering a first fracture, it should be viewed as a serious condition and the screening programme could be improved.

8 out of 10 GPs agree that if you prevent vertebral fractures you can stop secondary fractures.

7 out of 10 GPs agree that osteoporosis fractures are a major clinical problem and that bone fragility is part of the ageing process.
Summary

- 8 out of 10 GPs in France do **not** believe that the screening programme is sufficiently widespread and 9 out of 10 do **not** believe that it is sufficiently funded.
- 16% of doctors agreed that it is often the case that osteoporosis is not diagnosed until the woman presents with a first fracture.
Conclusions and Recommendations
Awareness
9 out of 10 women said that osteoporosis is a serious disease

Just less than half of all women suffering from osteoporosis were not aware they were at risk

Again, just less than half of sufferers were not aware that they had the disease prior to diagnosis

94% of doctors think that osteoporosis should be viewed as a serious condition

74% of doctors feel that osteoporosis fractures are a major clinical problem

Two-thirds of doctors cited osteoporosis as a health concern that they have amongst their postmenopausal patients.

However only 16% of postmenopausal women stated they were concerned about the disease
<Half the women had discussed osteoporosis with a doctor and of these, 25% said their doctor initiated the discussion.

>Half the women who have discussed the disease with a doctor have NOT discussed long term risks, mainly because the doctor did not raise them or they don’t want to think about them.

1 in 3 women will develop osteoporosis.

only a tenth of women feel they are very likely to develop the condition and only >third are very concerned about the long term health risks of osteoporosis.
Greater education is required amongst postmenopausal women

- one of the challenges doctors face is unwillingness of women to take long term medication
- greater education will generate a greater understanding of the disease and its consequences
- women will then be more concerned about osteoporosis and become more proactive in prevention/management
Impact on Daily Life
Impact on Daily Life

- 8 out of 10 doctors stated that the most negative effect of osteoporosis was fractures/breaking a bone, followed by pain.
- 9 out of 10 women associate osteoporosis with an increased risk of fracture, two-thirds loss of height, >half reduced quality of life, fear of next fracture/fall or long term pain.
- Of the women with osteoporosis, three-quarters stated that it had impacted on their quality of life (back pain, fear of breaking a bone, reduction in activities, less able to get from place to place).
- 85% of osteoporotics said they would have taken preventative medicine if they had known they were at risk.
Impact on Daily Life

- Given the impact of these effects, why are only 40% of postmenopausal women on medication for treatment (vs. >tenth of women who claim to be on treatment)
- If these women had been given earlier preventative medicine, the negative effects may have been avoided
Screening
Almost all the GPs said that their goal should be to prevent a first fracture, that osteoporosis should be viewed as a serious condition and that the main aim of management was to prevent fracture.

However less than a fifth of women have been screened for osteoporosis and on screening, just over half of women were identified as suffering from the disease.

If screening identifies the disease - why have only 11% of patients been recommended screening by their own doctor?

9 out of 10 doctors believe the screening programme should be improved.

9 out of 10 doctors believe that the screening programme is NOT sufficiently funded.

8 out of 10 doctors believe the screening programme is NOT sufficiently widespread.
Two-fifths of doctors think they either proactively or routinely conduct health risk assessments, in reality when asked for their definition of prevention, only 11% said ‘screening when a patient reaches the menopause’.

Despite wanting to prevent osteoporosis, doctors are not actively following this up via screening.

Over half the women were not aware that screening is even available.

Due to this lack of awareness, it is not surprising that only 64% of women strongly agree that osteoporosis can be prevented.

Two-thirds of doctors feel that women do NOT consult at an early enough stage.
The screening service clearly needs to be improved and promoted

- screening should take place earlier, leading to earlier diagnosis
- this will lead to long term prevention of fractures
- Over half of women stated that they would know if they had a vertebral fracture
- Women must be educated that osteoporosis can be a silent disease and that as soon as they go through the menopause they must actively request to be screened
Effective Prevention and Treatment
Effective prevention and treatment

- Three-quarters of doctors believe that osteoporosis fractures are a major clinical concern but only 50% of postmenopausal women are on preventative medicine.
- A third of doctors defined prevention as giving lifestyle advice rather than rxing medication.
- A quarter of osteoporosis sufferers are NOT on medication.
- However three-quarters of osteoporotics would have taken preventative medicine if they had known they were at risk.
- Women would take preventative medicine if their doctor recommended it.
- Four-fifths of doctors have experienced patients refusing to take long term preventative medicine, mainly because the women don’t want to take long term medication.
Effective prevention and treatment

- 86% of doctors believe that ideal candidates for prevention are women at risk of a vertebral fracture
- **Women need to understand why they should be on long term medication**
  - this should lead to an increase in the number of women being placed on medication and, more importantly, staying on medication
- Only 11% of women who had discussed osteoporosis with a doctor discussed osteoporosis medication options
- However, doctors estimated that 50% of their postmenopausal women patients are on preventative medication and 40% are rx'd treatment
Effective prevention and treatment

- 4 out of 10 women are concerned about the long term effects of HRT
- Doctors need to be made aware of these concerns so that patients comply with treatment
- When asked which features doctors consider important in an osteoporosis treatment, two-thirds said convenience / tolerability / GI side effects
- In turn women need to have a greater awareness that there are specific treatments as only a third indicated that osteoporosis can be prevented by the use of specific osteoporosis medications
Prescribing Inhibitors
Prescribing inhibitors

- Although a quarter of doctors said nothing inhibits their rxing, a fifth of doctors said lack of compliance is the greatest factor affecting their decision to rx a medication.
- Again, the biggest challenge doctors face when treating preventatively after the menopause is compliance, followed by patients concern over side effects.
- This in turn leads to an average of 60% of patients NOT being rxd medication for the treatment of osteoporosis and 50% NOT being prescribed preventative medicine.
- 80% of doctors have experienced patients refusing to take long term medication.
Prescribing inhibitors

- >quarter of doctors cite dislike of taking medication or that women don’t want to take long term medication as being key reasons for non-compliance
- Lobbying is required to create more funds to invest in this condition
- Again, doctors need to be educated that there are specific osteoporosis medications which are ‘cleaner’ than those currently used
- With greater education amongst patients, concerns about long term medication will be put to rest
Key Recommendations

- It is clearly obvious from the results of this survey that both doctors’ and postmenopausal women need greater education on the disease.
- If women receive preventative medicine, the widely reported negative effects of the disease will be avoided.
- The screening service needs to be improved and promoted.
- Women need to understand that osteoporosis is a silent disease and they should actively ask to be screened when reaching the menopause.
- Women need to understand the benefits of long term medication.
- Doctors need to be aware that there are specific osteoporosis products available which provide everything that they are asking for.
